

Alternative BDD Challenge

Context

The goal is to test selected features of a public API. You can choose one of the following:

- 1) Use the already exposed data <https://jsonplaceholder.typicode.com/> . To make it interesting, you can also upload your data and create hypothetical scenarios.
- 2) Select one of these APIS <https://any-api.com/> and select features and scenarios for the one selected.
- 3) Create a mock for an API . In this case, you will have to come up with an idea and set the business context and application in order to create the business stories (with their associated narrative, and scenarios in Gherkin), and of course, create the BDD for it.

Deliverables:

- You should create enough Gherkin scenarios for testing main features selected for your API choice.
- Present the features, scenarios and steps you have created and why.
- You should create a jbehave project to test these scenarios and present its execution.
- You should show your serenity report with tests run successfully.

Points to take into account:

- Since you may take the liberty to choose in this challenge, your creativity will be valued.
- Try your best to make your choice and work interesting: if it's too simple, you will not be learning much 😊
- Make sure to follow clean code guidelines.
- You may work in teams of 2-3 people.
- **Peer review your code: if your code has commented lines or debugging messages it will not be taken into account as delivered.**
